

### New for our 2010 Applications

All of our 2010 applications are packaged with a High-Performance, Enterprise-Level database. Unlike the majority of business applications built for small to medium size businesses, this application uses an Enterprise-Ready database.

Our Database	Competitor databases
Holds Terabytes of information (billions of pages)	Holds a minimal amount of data
Advanced transaction monitoring makes the database extremely reliable	Data files can become easily corrupted.
Designed to accommodate from up to thousands of users at the same time	Can only handle an extremely limited number of users without corrupting the database.
Performance remains consistent over the life of the application	Performance degrades as the database stores more information
Access your data from anywhere on your office network or/and anywhere on the internet.	Unable to access remotely—cannot work from home, on the road or any other remote location.

You will be able to use our database in any of the following configurations:

1. Install the Database and the Application on the same computer.
2. Install the Database on 1 computer and the Application on another computer within your Office Network.
3. Install the Database on 1 computer and the Application on an unlimited number of computers within your Office Network.
4. Install the database on 1 computer and the Application on workers laptops to use from home(for home-based workers) or on the road. Managers will be able to run reports from home or on the road.

### Summary:

The database that we use is far superior to the databases of our competitors. It allows you virtually unlimited flexibility, performance and scalability.
